

Vo Dong Duy
Backend Developer
(Fullstack-oriented)

19/09/2001

Male

com

Objective

Backend Developer with nearly 2 years of hands-on experience working on production systems in healthcare environments. Strong background in building and maintaining RESTful APIs, implementing secure authentication (JWT, OAuth2), and developing real-time features using WebSocket. Experienced in collaborating directly with end-users and cross-functional teams to analyze business requirements, troubleshoot production issues, and improve system performance and reliability. Solid understanding of database design, query optimization, and system debugging. Capable of contributing across the fullstack when needed, with a strong focus on backend development. Seeking to grow into a professional Fullstack Developer with a solid backend foundation and system design capabilities

Work experience

Tam Anh Hospital

12/2024 - 05/2026

Application Support Engineer

- Analyzed and clarified business requirements from end-users, ensuring system functionality aligned with real-world operational needs
- Directly handled daily production issues, coordinating with the development team on fixes – handled over 80 incidents/day while maintaining system availability above 99% and resolving more than 90% of incidents within SLA
- Performed pre-deployment testing and verified system functionality after releases to reduce post-release defects and ensure system reliability
- Performed SQL-based data validation, analysis, and reporting
- Conducted root cause analysis on system errors and proposed solutions to prevent recurrence
- Collaborated closely with development teams and end-users to improve system stability, user experience, and day-to-day operational workflows

Hanh Phuc International Hospital

01/2024 - 12/2024

Software Developer

- Maintained and enhanced internal web applications supporting hospital and clinic operations
- Built an equipment asset-management system in PHP Laravel for ~30 users across 5 departments (Purchasing, Accounting, IT, Medical Equipment, Building Maintenance & Operations); tracked the owning department, and transfer history
- Solved department-level access control with Spatie Laravel-Permission (Role-Based Access Control), ensuring each department could only act within its assigned scope of assets; built a server-side asset listing with Server-side DataTables (Yajra) combined with AJAX for smooth search, filtering, and pagination on large datasets without page reloads, plus an Audit trail log of asset transfer history (who made the change, when, and old/new values)
- Built a meal-ordering system serving under 100 patients/day, with the menu split into 2 categories by patient type: inpatient and outpatient; solved the no-login-access problem using Laravel Signed Route to generate 2 separate secure, tokenized links (one per category), then

wrapped each link into a QR code (using the browser's built-in QR generator, no coded library needed) to print and post in each area – patients scan the code for their area to view each meal's options and place orders straight to the kitchen

- Built a pre-visit survey system for under 100 patients registering for Nutrition Department consultations: applied the same QR + Laravel Signed Route approach so patients could fill out an intake form without an account, validating input with Laravel Form Request; aggregated and visualized results on a chart dashboard, giving doctors baseline information before the visit for more accurate consultation and treatment
- Common tech stack for the 3 systems above: PHP Laravel (monolithic MVC), MySQL, Blade, Bootstrap, jQuery/AJAX, Spatie Laravel-Permission, Yajra DataTables, Laravel Signed Route, Laravel Form Request, Audit trail log, Laravel Excel (report export), Chart.js (survey data visualization); QR codes were generated using the browser's built-in QR tool from the Signed Route links, with no separate QR-generation library needed
- Supported departments in extracting and analyzing data for reporting; provided technical support for hardware, software, and internal network systems, and managed the full IT-asset lifecycle for employees

Yersin International Clinic

09/2023 - 12/2023

Freelance Developer

- Gathered and analyzed user requirements to define system functionality
- Designed the database structure to efficiently manage medical data
- Solved the problem of visually representing a full adult jaw with an interactive SVG diagram built in JavaScript, where each tooth is its own SVG element linked to a treatment record in the database (patient – tooth – condition – treatment history relation), letting under 10 dentists at the clinic click into individual teeth to view, diagnose, and set the correct treatment plan for each case
- Tech stack: PHP CrudBooster (a rapid-application-development framework built on Laravel) to quickly scaffold standard CRUD screens (condition categories, patient records, appointment schedules), freeing up development time for the interactive tooth diagram; MySQL, Bootstrap, jQuery/AJAX, interactive tooth diagram built with SVG + JavaScript
- Delivered a customized solution tailored to the clinic's specific business needs

FPT Information System

07/2023 - 09/2023

Website Developer Intern

- Developed user interfaces using Liferay and built backend APIs using Java
- Implemented parameter management modules based on business requirements
- Built automation bots (Akabot) to scrape and process data from websites into databases
- Gained experience working in enterprise-level development environments

Project

Social Networking App (Team Project)

Backend Developer

- Designed and built a RESTful backend with ~37 API endpoints across 5 business modules (auth, newsfeed, posts, messaging, users), powering a native Android (Java) client app
- Built a JWT-based authentication flow combined with email OTP verification (Nodemailer + Gmail OAuth2) for sign-up/password recovery; hashed passwords and OTPs with bcrypt and validated input with Joi
- Built real-time chat with Socket.IO: maintained a user-socket mapping in the database to support multi-device message/notification delivery, with real-time read-status and unread-count updates

- Designed a hybrid data model: MySQL (Sequelize ORM) for relational data (users, posts, follows, likes, comments, conversations, messages) and MongoDB (Mongoose) for short-lived OTP data; used database transactions for multi-table writes (creating conversations, creating posts with images)
- Integrated the Google Drive API (OAuth2) as storage for avatars and post images; applied Helmet, CORS, and Morgan for API security and logging
- Tech stack: Node.js, Express.js, Socket.IO, Sequelize (MySQL), Mongoose (MongoDB), JWT, Joi, Nodemailer, Google APIs (OAuth2/Drive)

Project / GitHub link : <https://github.com/DUYVO62/SocialApp>

Technical Skills

Programming Languages	- Primary: Java, JavaScript - Secondary: PHP, C#
Backend Development	- RESTful API Design & Development - Authentication & Authorization: JWT, OAuth2 - Real-time Systems: WebSocket, Socket.IO - System Integration & API Integration - Role-Based Access Control (RBAC)
Frameworks & Technologies	- Backend: Spring Boot, Node.js (Express), Laravel - Frontend: HTML, CSS, JavaScript, Bootstrap, jQuery, AJAX
Database	- MySQL, PostgreSQL, SQL Server, MongoDB - Query Optimization, Data Validation - Relational Database Design
System & Tools	- Git, GitLab - CI/CD (GitHub Actions, GitLab CI – basic)

Education

POSTS AND TELECOMMUNICATIONS INSTITUTE OF TECHNOLOGY (PTIT)

2019 - 2024

Bachelor of Software Engineering

Graduation Classification: Good

English

- Reading technical documentation
- Basic communication

Career Objective

Short-term: Strengthen backend development expertise while expanding frontend skills to build complete, production-ready web applications

Long-term: Become a professional Fullstack Developer with strong backend and system design capabilities, able to build scalable, high-performance systems and deliver end-to-end solutions
